# Algorithms to estimate the NDVI-**PPNA** relationship in grasslands

ARGENTINA / UNITED STATES / URUGUAY

## The technological solution

Use of information provided by remote sensors with field data and simulation models to calibrate the relationship between the Normalized Green Index (NDVI) and the Primary Net Air Productivity (PPNA) for different forage resources and environments.

### **Description**

The algorithms provide regional estimates of primary productivity derived from satellite images and other environmental sensors in real time. Information is provided to producers with estimates of forage productivity at the pasture level on a monthly basis.

#### Results

- A model of the NDVI-PPNA relationship for grasslands developed.
- Weather forecast information and pasture growth with a monthly frequency.
- Training for technicians and producers.
- Satellite and climatic information of the intervention area.

#### **ABOUT FONTAGRO**

FONTAGRO is a unique cooperation mechanism for agricultural innovation in Latin America and the Caribbean (ALC) and Spain, that works through regional platforms. It is composed of 15 countries that have contributed capital exceeding 100 million dollars and the Inter-American Development Bank (IDB), which is its legal representative.

ORIGIN OF RESOURCES

PARTICIPATION AND ROLE IN CONSORTIUMS SINCE 1998

FONTAGRO IN NUMBERS

- Ocunterpart contribution 93.177.555
- FONTAGRO 28.989.468
- 9.922.700
- Other agencies 9.809.078
